

Pharmacy Software Solutions

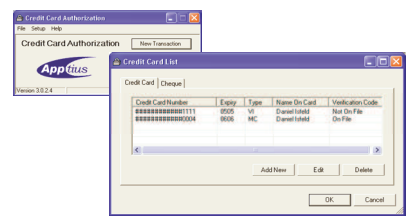

Where does RxVantage fit into the Pharmacy business flow?

The **Patient Relationship Manager** can be used to track the all contact with customers. Reports could be generated to determine who has called, but not yet placed an order. The application assists in the development of call-back processes to capture additional revenues and strengthen customer relationships.

The **Apptius Payment Processing Module** can be used to move from a manual stand-alone credit card authorization device to a full on-line transaction. Customer credit card information can be stored, in encrypted form, to speed up the re-order process for important return customers.

The **Apptius Shipping Module** can be used to eliminate the manual re-entry of address information required before shipping. The information already recorded in the dispensing application can be used to eliminate this step. Further, the labels required can be batched to create an import to the shipping label application for processing multiple orders at one time.
